

BLACK OXIDE STAINLESS CABLE DISCLAIMER

The black oxide stainless steel cable product requires special handling and care to preserve the appearance and integrity of the cable railing installation.

Performance

Black oxide is a custom finish that may contain surface imperfections and is susceptible to scratches, fading, and discoloration if mistreated. Bezdán cannot guarantee the consistency or performance of black oxide cable.

Special Handling Required

Upon receiving your order, be advised that the black oxide cable product may obtain an oily or powdery residue as a result of the oxidizing process.

Black oxide cable, like any product with an applied finish, will acquire damage or will come off when mishandled. We suggest using a powder-free industrial grade glove made from nitrile when handling and installing the cable and wiping the cable down following installation.

Maintenance & Care

While the black oxide finish provides an additional layer of protection to the marine-grade stainless steel, utilizing a suitable cleaner and applying a protective product can lengthen the life of the product's aesthetics and quality.

Upon completion of your installation, we recommend rinsing the product by hand with a damp, lint-free cloth to remove excess oil and residue, fingerprints, and other contaminating particles. After cleaning, apply a spray-on protective coating, like the Boeshield T-9.
